ABSTRACT

The Indonesian government, to realize health development through family health improvement priorities, has issued work programs to support the implementation of the matter. One of the government programs implemented at this time is the family planning program. Virile participation in both planning and living in the maintenance of motherhood and child health, including the prevention of motherly mortality, is a still base. Based on this, it is important to know the cause of base masculine participation in planning families. This study aims to analyze the determining factor of participation of men in family planning. This research is a policy study, meaning that research is aimed at obtaining information as a basis for decision-making concerning men's interest factors for enlivening and the planning family. This research was conducted in Donggala County. The population in this study is a man of childbearing age (PUS) located in all regions of Donggala Regency. The analysis used in this study is a frequency tabulation analysis. The study concluded that if you want to use a vasectomy, contraceptive tools should not be decided with a partner, but most of the respondents must be decided with a partner because the contraceptive vasectomy is a family. An effective plan for the childbearing age to prevent pregnancy with a single action, so that there must be a husband's agreement to do already not want any further descendants.

Keywords — Men, Family Planning, Participation, Costly Fees

INTRODUCTION

The Indonesian government, in an effort to realize health development through family health improvement priorities, has issued work programs to support the implementation of the matter. One of the government programs implemented at this time is the family planning program (1).

The efforts to increase the participation of men in the family planning that have been measured by the level of male harmony through the use of contraceptives such as condoms and men's operative Methods (MOP) have gained serious attention from the government since Gender equality in

living planning. A husband now is not allowed to care about living planning because it has become a common affair. It would be more important if the husband acted directly through the use of a condom contraceptive device or MOP or in other words, become participants of the family planning (2).

Male participation in both planning and living in the maintenance of motherly and child health, including the prevention of maternalistic mortality, is still low. Based on this, it is important to know the cause of virile base participation in planning families. Through this study, it is expected to provide an overview as well as relevant

information on male interest-determination factors to participate in planning families. In this study, factors were seen from three things; Predisposing factor, supporting factor and driving factor. By knowing that the relevant agencies can take the policy and conduct the action plan so that for than expected the participation of men to participate in the planned family of higher planning and support the achievement of the plan National Medium Term Development, which is the mandate of the achievement of the number of family participants planning in men. (3-6)

This study aims to analyze the determining factor of participation of men in family planning.

METHODOLOGY

This research is a policy study, meaning that research is aimed at obtaining information as a basis for decision-making about men's interest factors for enlivening and the planning family. This research was conducted in Donggala County. The population in this study is a man of childbearing age (PUS) located in all regions of Donggala Regency. The analysis used in this study is a frequency tabulation analysis.

RESULT & DISCUSSION

The study findings found that one element of the motivation of a fertile age pair in men is if they have a desire to participate in a planned family based on survey data obtained in the field about the desire of men in family planning. Based on the respondent's response can be shown in the following figure.

A strong motivating factor is if a person feels a particular job. Similarly, the family planning in men, if this membership is quite endeared, then surely men will fully support the program of the family planning men who

are encouraged by the Government, who are very expecting membership in the family plan men annually may increase. (7).

Being a family participant planning in a man should be carried out not on compulsion, but it is best to appear on his consciousness because it considers that family affairs planning not only for women but also in men can do it the same as women, let alone now it issue gender that does not distinguish between men, and women are being encouraged by the government.

The role of the Donggala District government to further encourage male participation in family planning is indispensable, by giving rational consideration that now the equality between women and men in participating in the family plan.

The Government's development for participants planning in men must be done, especially from Donggala Regency Government, even if it is necessary to give incentives for their children, so this is a fascination for other men. To participate in a planned family.

The participation of men in family planning is determined by the role of officers in providing counseling to men. The task has been to make lectures on men, and most have never said. This has an impact on the lack of interest of men to participate in family planning because it does not quite have an adequate understanding of the planning family. Therefore, it is expected to the local government of Donggala to further enable the family planning officers to intensively provide more focused counseling to the fertile age pair in men to participate in planning families, By using polite and friendly ways. (4, 8)

Method of counseling should indeed have to be shifted, no longer attention directed to the participants of family planning women, but already have

to give more attention to the male PUS, especially to pursue targets as mandated in the National RPJM 2013.

In an effort to improve the inspection of the national planning movement. The man's role is very important, and Menen, as the head of the male family is the backbone of the family and is always involved in making decisions about the welfare of the family, including determining the number of children desired.

The family Planning program is a program intended to assist couples and individuals in achieving their reproductive objectives, preventing unwanted pregnancies and reducing pregnancy incidents at high risk, pain and death, doing quality service, affordable, acceptable and easy to obtain for all those in need; Improving the quality of advice, communication, information, education, counseling and service; Increasing men's participation and responsibilities in planning family practices.

Efforts to realize equality and gender justice in the Family planning program, namely by way of increasing male participation. The change in policy will expand access to planning and reproductive health services for men, in addition to the quality of service that will increase due to more attention to issues of equality and gender justice. Women and men have the same roles and responsibilities in improving the health quality of their reproduction, including family planning and parenting, but in fact, male roles are still low.

CONCLUSIONS

The study concluded that if you want to use a vasectomy, the contraceptive tool should not be decided with a partner, but most of the respondents must be decided with a partner because the contraceptive

vasectomy is a family. An effective plan for the childbearing age to prevent pregnancy with a single action, so that there must be a husband's agreement to do already not want any further descendants. This review recommends to the community, especially the fertile age couple in men who have participated in the family planning to participate in providing understanding and understanding of the importance of men participating in the planning family.
